A Dock Leveler Lifting Bar is an accessory used to install a pit or pour in style dock leveler using a fork truck. The lift bar provides a safe and efficient means to move the dock leveler into position during the installation process. Using the threaded anchor points, the accessory is simply threaded by hand into the top of the dock leveler. When the bolts are firmly secure, a fork truck driver can safely pick up and move the dock.
leveler. Depending on the size of the dock leveler a piece of wood should be laid either in front or behind lifting bar to assure a more level dock when installing (shown in picture to the right). Included in the lifting bar are two nuts at each end used to secure and store the bolts when the lifting bar is not in use (shown in bottom picture). The maximum capacity of the dock leveler lifting bar is 2200 lbs. The pictures provide a visual of how the accessory can be used.
